DATE MAILED: 01/17/2006

Please find below and/or attached an Office communication concerning this application or proceeding.

**Office Action Summary**

Application No.

10/802,751

Applicant(s)

AOSHIMA ET AL.

Examiner

Stephen M. D'Agosta

Art Unit

2683

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

**Period for Reply**

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

**Status**

- 1) ☐ Responsive to communication(s) filed on \_\_\_\_.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

**Disposition of Claims**

- 4) ☒ Claim(s) 1-17 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1, 3-5, 7-10, 13, 14 and 17 is/are rejected.
- 7) ☒ Claim(s) 2, 6, 11, 12, 15 and 16 is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_ are subject to restriction and/or election requirement.

**Application Papers**

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 18 March 2004 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

**Priority under 35 U.S.C. § 119**

- 12) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☒ All b) ☐ Some \* c) ☐ None of:
1. ☒ Certified copies of the priority documents have been received.
  2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_.
  3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

**Attachment(s)**

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☐ Information Disclosure Statement(s) (PTO-1449 or PTO/SB/08)  
Paper No(s)/Mail Date \_\_\_\_.
- 4) ☐ Interview Summary (PTO-413)  
Paper No(s)/Mail Date. \_\_\_\_.
- 5) ☐ Notice of Informal Patent Application (PTO-152)
- 6) ☐ Other: \_\_\_\_.

## DETAILED ACTION

### *Specification*

The title of the invention is not descriptive. A new title is required that is clearly indicative of the invention to which the claims are directed.

### ***Claim Rejections - 35 USC § 103***

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

**Claims 1, 3-4 and 9** rejected under 35 U.S.C. 103(a) as being unpatentable over Nickum and further in view of Hawkins et al. US 6,516,202 and Usui 2002/0025839.

As per **claims 1 and 9**, Nickum teaches a small electronic device (figures 1-2 show a laptop which has cell phone/pager plug-ins) comprising:

Art Unit: 2683

a battery (laptop, phone and pager inherently have batteries);

a battery level detection unit for detecting a charge level of the battery (the cell phone and laptop inherently have battery level detection units, eg. phones and laptops typically have an "icon" on the display that reflects how much battery power remains);

a display unit for displaying various data (laptop, phone and pager inherently have a display (eg. LCD, etc) which is used to display information to the user);

**but is silent on**

a communication unit for exchanging data with an external device, wherein the small electronic device receives battery level data of the external device detected by the external device, compares the data with its own battery level data output from the battery level detection unit, and displays a comparison result on the display unit.

Nickum does teach "There is a need for a better way to obtain the benefits of each of these devices in a more convenient manner. There is a further need for better ways to manage batteries used to power such devices." (Para. #0007) and that power can be supplied to all the devices from one power supply, "When cellular telephone 14 is placed into cradle 13, suitable connections between portable computer 12 and cellular telephone 14 are made to allow the cellular telephone 14 and the portable computer 12 to operate from the power supply 18 of portable computer 12. (Para. 0021). Hence one skilled understands that the user would require knowledge of both the cell phone's battery level along with the laptop's battery level (since it is the primary source of power – eg. if the phone's battery is running low, the user will want to check to see if sufficient laptop battery power is available to re-charge the phone).

**Hawkins** teaches a combined PDA/Cell phone whereby Battery Level Data (figure 4, #490) is monitored and transferred between the devices "For one embodiment, the microcontroller 460 also monitors the battery level signal 490. If the battery level signal 490 indicates that the organizer does not have a battery in or if the battery level

Art Unit: 2683

is below a threshold, the microcontroller 460 does not send the interrupt signal 485. Generally, when a call is received, the organizer is asked to respond. Using the battery level signal 490, the organizer is not asked to respond when the battery level is below the threshold. This prevents the stand-by power from being exhausted, possibly leading to memory loss. (C4, L37-46) .

Further to this point, **Usui** teaches a device which has 1<sup>st</sup> and 2<sup>nd</sup> wireless and power control sections/units whereby a battery of the second wireless section intermittently toggled from ON to OFF in order to conserve battery power (abstract).

It would have been obvious to one skilled in the art at the time of the invention to modify Nickum, such that a communication unit for exchanging data with an external device, wherein the small electronic device receives battery level data of the external device detected by the external device, compares the data with its own battery level data output from the battery level detection unit, and displays a comparison result on the display unit, to provide means for the user to know the battery level status of each device's battery.

As per **claims 3-4**, Nickum teaches claim 1, wherein the small electronic device is a portable PC device/Cell phone (see figures 1-2 which teach a laptop, cell phone and/or pager).

Art Unit: 2683

**Claims 5, 7-8, 10 and 13-14** rejected under 35 U.S.C. 103(a) as being unpatentable over Nickum and further in view of Hawkins et al. US 6,516,202 and Nakai US 6,928,567.

As per **claims 5 and 13**, Nickum teaches a small electronic device (figures 1-2 show a laptop which has cell phone/pager plug-ins) comprising:

- a battery (laptop, phone and pager inherently have batteries);

- a battery level detection unit for detecting a charge level of the battery (the cell phone and laptop inherently have battery level detection units, eg. phones and laptops typically have an "icon" on the display that reflects how much battery power remains);

- a display unit for displaying various data (laptop, phone and pager inherently have a display (eg. LCD, etc) which is used to display information to the user);

**but is silent on**

- a communication unit for exchanging data with an external device, wherein the small electronic device receives operating time data of the external device calculated from a battery level detected by the external device, compares the data with its own operating time data calculated from a battery level output from the battery level detection unit, and displays a comparison result on the display unit.

Nickum does teach "There is a need for a better way to obtain the benefits of each of these devices in a more convenient manner. There is a further need for better ways to manage batteries used to power such devices." (Para. #0007) and that power can be supplied to all the devices from one power supply, "When cellular telephone 14 is placed into cradle 13, suitable connections between portable computer 12 and cellular telephone 14 are made to allow the cellular telephone 14 and the portable computer 12 to operate from the power supply 18 of portable computer 12." (Para. 0021). Hence one skilled understands that the user would require knowledge of both the cell phone's battery level along with the laptop's battery level (since it is the primary

Art Unit: 2683

source of power – eg. if the phone's battery is running low, the user will want to check to see if sufficient laptop battery power is available to re-charge the phone).

Hawkins teaches a combined PDA/Cell phone whereby Battery Level Data (figure 4, #490) is monitored and transferred between the devices "For one embodiment, the microcontroller 460 also monitors the battery level signal 490. If the battery level signal 490 indicates that the organizer does not have a battery in or if the battery level is below a threshold, the microcontroller 460 does not send the interrupt signal 485. Generally, when a call is received, the organizer is asked to respond. Using the battery level signal 490, the organizer is not asked to respond when the battery level is below the threshold. This prevents the stand-by power from being exhausted, possibly leading to memory loss. (C4, L37-46) .

Nakai teaches "Battery information is transmitted from a recording and playback apparatus to a host computer. In the host computer, based on the time for which operation can be continued, corresponding to the current operating status and the remaining battery level, which is stored in battery information, a warning is output, the data of a cache memory is written, data writing prohibition is set, and a forced closing process is performed" (abstract).

It would have been obvious to one skilled in the art at the time of the invention to modify Nickum, such that a communication unit for exchanging data with an external device, wherein the small electronic device receives operating time data of the external device calculated from a battery level detected by the external device, compares the data with its own operating time data calculated from a battery level output from the battery level detection unit, and displays a comparison result on the display unit, to provide means for the user to know the battery level status and operating time remaining of each device's battery.

Art Unit: 2683

As per **claims 7-8**, Nickum teaches claim 5 wherein the small electronic device is a portable PC device/Cell phone (see figures 1-2 which teach a laptop, cell phone and/or pager).

As per **claims 10 and 14**, Nickum teaches claim 9/13, **but is silent on** wherein the transmitting of the battery level data is triggered by satisfying predetermined conditions.

Bryne teaches transmitting data from one device to another device if/when the battery level data satisfies a predetermined condition "FIG. 2 shows a more detailed embodiment 20 of the first aspect of the present invention. Transmitter 23 may transmit a signal 26 to a wrist watch 25 that contains an alert mechanism 24. When signal 26 is received by alert mechanism 24, the mechanism may indicate to the user that an event has occurred in personal electronic device 22. Transmitter 23 may be configured to identify the personal electronic device having the event (such as the user's phone), identify the type of event on the device (such as that fact that the phone is ringing or the phone's battery is low), and identify particulars of the event (such as the telephone number or the phone's battery level). (eg. low battery – see C2, L55-67).

It would have been obvious to one skilled in the art at the time of the invention to modify Nickum, such that the transmitting of the battery level data is triggered by satisfying predetermined conditions, to provide means for the user to be alerted to a low battery situation.

**Claim 17** rejected under 35 U.S.C. 103(a) as being unpatentable over Nickum and further in view of Hawkins et al. US 6,516,202 and Wang 2003/0013506.

As per **claim 17**, Nickum teaches a small electronic device (figures 1-2 show a laptop which has cell phone/pager plug-ins) comprising:

a battery (laptop, phone and pager inherently have batteries);

a battery level detection unit for detecting a charge level of the battery (the cell phone and laptop inherently have battery level detection units, eg. phones and laptops typically have an "icon" on the display that reflects how much battery power remains);

a display unit for displaying various data (laptop, phone and pager inherently have a display (eg. LCD, etc) which is used to display information to the user);

**but is silent on**

a battery housing attached to said small electronic device as a driving power source and a communication unit for transmitting the charge level (**eg. *Battery Indicator***) to an external device to display a comparison result between the charge level of the small electronic device and a charge level of the external device.

Nickum does teach "There is a need for a better way to obtain the benefits of each of these devices in a more convenient manner. There is a further need for better ways to manage batteries used to power such devices." (Para. #0007) and that power can be supplied to all the devices from one power supply, "When cellular telephone 14 is placed into cradle 13, suitable connections between portable computer 12 and cellular telephone 14 are made to allow the cellular telephone 14 and the portable computer 12 to operate from the power supply 18 of portable computer 12. (Para. 0021). Hence one skilled understands that the user would require knowledge of both the cell phone's battery level along with the laptop's battery level (since it is the primary source of power – eg. if the phone's battery is running low, the user will want to check to see if sufficient laptop battery power is available to re-charge the phone).

Art Unit: 2683

Hawkins teaches a combined PDA/Cell phone whereby Battery Level Data (figure 4, #490) is monitored and transferred between the devices "For one embodiment, the microcontroller 460 also monitors the battery level signal 490. If the battery level signal 490 indicates that the organizer does not have a battery in or if the battery level is below a threshold, the microcontroller 460 does not send the interrupt signal 485. Generally, when a call is received, the organizer is asked to respond. Using the battery level signal 490, the organizer is not asked to respond when the battery level is below the threshold. This prevents the stand-by power from being exhausted, possibly leading to memory loss. (C4, L37-46) .

Wang teaches a phone with a battery housing/assembly (abstract and figures).

It would have been obvious to one skilled in the art at the time of the invention to modify Nickum, such that a battery housing attached to said small electronic device as a driving power source and a communication unit for transmitting the charge level (*eg. Battery Indicator*) to an external device to display a comparison result between the charge level of the small electronic device and a charge level of the external device, to provide means for the device to have a battery housing whereby Battery Level data can be determined by the user for all devices.

***Allowable Subject Matter***

**Claims 2, 6, 11-12 and 15-16** objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

The prior art or record, alone or in combination, does not teach:

Claim 2: A small electronic device according to claim 1, wherein the comparison result comprises lower battery level data selected from the battery level data of the external device and the battery level data of the small electronic device.

Claim 6: A small electronic device according to claim 5, wherein the comparison result comprises shorter operating time data selected from the operating time data of the external device and the operating time data of the small electronic device.

Claim 11: wherein the transmitting of the battery level data is triggered in response to a request from the second small electronic device.

Claim 12: wherein the comparison result in the displaying step comprises lower battery level data selected from the battery level data of the first small electronic device and the battery level data of the second small electronic device.

Claim 15: The monitoring method according to claim 13, wherein the transmitting of the operating time data is triggered in response to a request from the second small electronic device.

Claim 16: The monitoring method according to claim 13, wherein the comparison result in the displaying step comprises shorter operating time data selected from the operating time data of the first small electronic device and the operating time data of the second small electronic device.

**Conclusion**

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.
